

Funda

About

As part of a job application I created a small javascript based application that consumed an API (Funda's own API backend) via a PHP applet. The javascript webapp consumes the api and displays all the images on the server with the option to check each version of the image on the (Sizes marked in Dutch because that was where the job was located). The creation of this application helped me understand PHP Package Management (with Composer) and API consumption with an applet. I am currently in the process of remaking it with React to see if I can improve on it with React's component based design.

Skills Used

PHP, JavaScript, Package Management (Composer), API Manipulation, JSON.

Girls Brigade Scotland

About

I have worked with Girls Brigade Scotland as their website support officer and website administrator for just under ten years. Working with outside companies, the website has gone from a static website to using CMS backbends, first Drupal and then WordPress in the course of three redesigns. Each update of the website provided more functionality to the members of GBS and simplify workflows in HQ. Examples include e-commerce through WooCommerce and Company Listings.

Skills Used

PHP, MySQL, Website Administration, cPanel, WordPress, WooCommerce

DarkSky React

About

This single page web app consumes two APIs; Google Location Service and DarkSky's Weather service and uses the output of those APIs to display the weather for today and the next five days. This project allowed me to improve my skills and JavaScript and allowed me to put into use my skills in package management and the react framework.

Skills Used

JavaScript, NodeJS, git, SCSS, React, Symantic UI, Netlify, GitHub
